- Tutorial
  - Deployment
  - Calibration
  - Controlling the NIMS node
  - Sampling
  - Data merging
- Questions and Answers
- NIMS demonstration

# Networked Infomechanical Systems (NIMS) Approach

NIMS

- Require *active* architecture with:
  - autonomous *physical configuration*
  - fixed and actuated sensors
- Require adaptation
  - In-field
- Require actuation attributes:
  - Transport large instruments
  - 3D volume access
  - Extensive
  - Reliable
  - Low environmental impact
- Networked Infomechanical Systems (NIMS)
  - *One deployment – many sample locations*

# Actuated Observation: Driven by *Sampling* Requirements

NIMS

- Current Systems and Observations
  - Field NIMS
    - Solar radiation
  - River NIMS
    - Aquatic contaminants
  - NIMS Thermal Mapper
    - Plant physiology
  - NIMS Laser Mapper
    - Ecosystem structure
- Common Application Characteristics
  - Field variables display high spatial frequency over large area
  - Oversampling not practical
  - *Actuated* and *fixed* sensing required

# Comparison with Prior Methods

NIMS

Manual

NIMS

- High resolution profile of flow and contaminants
- *Direct* high resolution measurements of contaminant mass flow
- *Track* input/output of contaminant sources
- **1000x improvement in sampling capacity!**

# NIMS RD: San Joaquin River System

**UC Merced:** Jason Fisher, Sandra Villa-Millazar, Robert Foster, Chris Butler, Tom Harmon

**UCLA:** Robert Gilbert, Eric Graham, Yeung Lam, Michael Stealey, and Eric Yuen

San Joaquin River

Merced River

## Merced-San Joaquin River Confluence

- **River monitoring management**
  - Spatially resolved for total mass flow
- **Contamination**
  - Public health and agricultural land loss
- **Status**
  - Currently undersampled

# NIMS RD Software Suite

NIMS

- Written in cross-platform language Python
- Windows and Linux compatible
- Main software programs

# nimsrddmenu.py

NIMS

## Main Menu

```
C:\WINDOWS\system32\cmd.exe - nimsrddmenu.py
serial port not given, use default
Initialized motor ID: 1
Initialized motor ID: 2
resolution set to: 4096
steps per meter set to: 59172
velocity set to: 0.50 m/s
acceleration set to: 0.25 m/s^2
main function
-----NIMSRD OPTIONS-----

(m)ove node
(p)ositional query
(k)eyboard control
(v)elocity adjust (m/s)
(a)ccelration adjust (m/s^2)

(c)alibrate system
(b)oundary information
(l)oad calibration file

(f)ile based mode
(s)tatus of motors
(q)uit and exit

Enter choice:
```

# nimsrdmenu.py

# NIMS

## Move Node

```
C:\WINDOWS\system32\cmd.exe - nimsrdmenu.py
-----Keyboard Control-----

Use arrow keys to move shuttle:
up arrow    = Move node up
down arrow  = Move node down
left arrow  = Move shuttle in - direction
right arrow = Move shuttle in + direction
space bar   = Stop shuttle once in motion
k           = Kill all motion immediately

Use following keys to interact with system:
p           = Positional information
a           = Acceleration change mode (rps)
v           = Velocity change mode (rps)
r           = Reset Motor Distance to zero
q (esc)     = Quit Control mode
```

# nimsrdmenu.py - Calibration

NIMS

## Calibration (new calibration)

```
C:\WINDOWS\system32\cmd.exe - nimsrdmenu.py

-----Keyboard Control-----

Use arrow keys to move shuttle:
up arrow    = Move node up
down arrow  = Move node down
left arrow  = Move shuttle in - direction
right arrow = Move shuttle in + direction
space bar   = Stop shuttle once in motion
k           = Kill all motion immediately

Use following keys to interact with system:
p           = Positional information
a           = Acceleration change mode (rps)
v           = Velocity change mode (rps)
r           = Reset Motor Distance to zero
s           = Save collected points to file
l           = Load new calibration point
q (esc)     = Quit Control mode

Use the arrow keys and space-bar to move the node to the first
position in the transect
NOTE: The first point in the transect should be set to x = 0
```

# nimsrdmenu.py - Calibration

NIMS

## Calibration

1. Manually move the starting position to the origin
2. Press 'l' key in the calibration menu to start
3. Enter the measured position
4. Move to the next location
5. Repeat steps 3 and 4 until the end of the transect is reached
6. Press 's' to save the configuration file

# nimsrddmenu.py - Boundaries

NIMS

# nimsrdmenu.py - Boundaries

NIMS

## Boundary Menu

```
-----BOUNDS OPTIONS-----  
(p)rint current boundary points  
(e)nable boundary checking  
(d)isable boundary checking  
(c)lear boundary points  
(s)et boundary points
```

points\_raster.py

NIMS

Courtesy of CENS

# points\_raster.py

NIMS

## How to Do a Raster Scan

1. Create 'points.txt'
2. Open up a terminal for the 'nimsrdmenu.py' program
3. Run 'points\_raster.py'
4. File is outputted to '[year]-[month]-[day].txt'

## How to do a Raster Scan

```
<x> <y> <dwell>
```

- (There are spaces between each of the three elements in the line)
- <x>: NIMSRD x-position in meters
- <y>: NIMSRD y-position in meters
- <dwell>: amount of time to spend at that particular position in seconds

```
0 0 5
1 0 5
2 0 5
2 1 5
1 1 5
0 1 5
```

'points.txt' sample file

'points.txt' file format

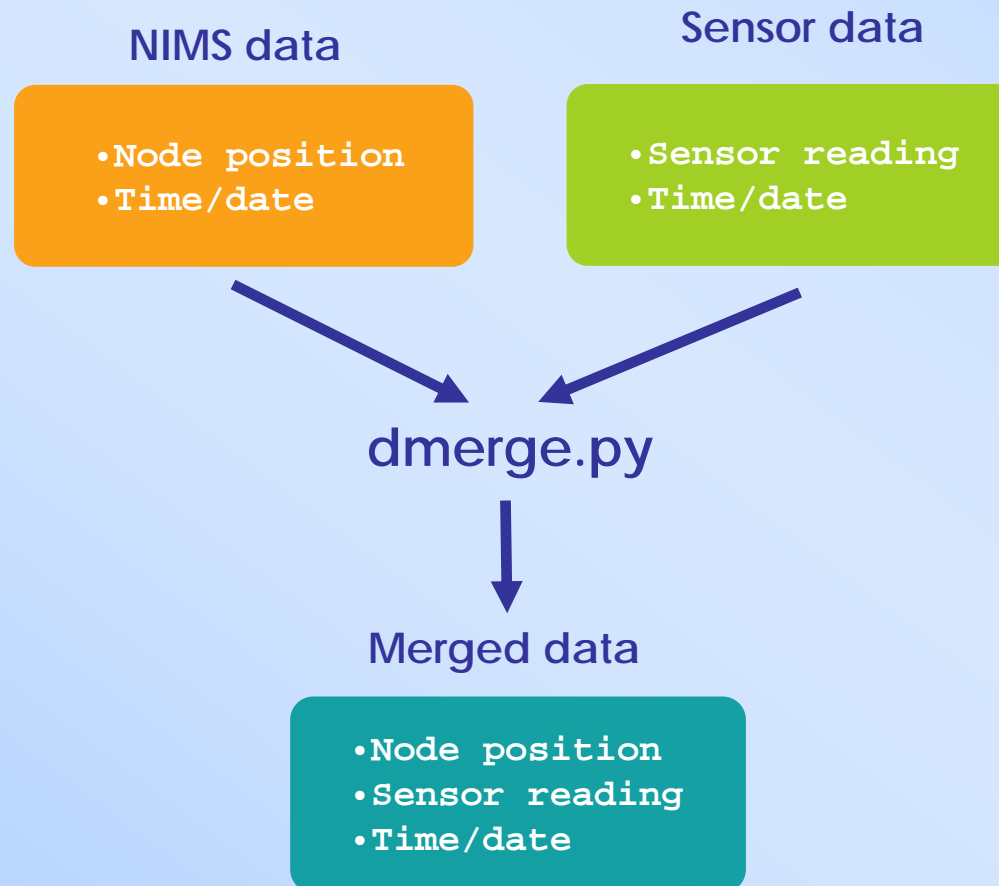

# dmerge.py – Merging Data

NIMS

## Merging NIMS Positional Data with Sensor Data

# Sample Merged Data Plot

NIMS

# Future Developments

NIMS

- Simplify the deployment process
- Embedded computer for autonomous mode
- Self-calibration
- Size and weight reduction
- Integration with wireless data acquisition

# Demonstration
